

BARBER-OES
OPERATIONAL ECOSYSTEM

One system for every line, batch, and shift on the floor.

*Built for manufacturing, adaptable to any operations-heavy industry —
by someone who ran the floor, not just the software.*

75+ →

CI findings actioned

Most floors still run on paper, memory, and whoever answered the phone last.

1**No real-time visibility**

A batch falls behind and nobody knows until the shift meeting — or the missed ship date.

2**Tribal knowledge risk**

The one person who “knows how the spreadsheet works” is out sick, and everything stalls.

3**Decisions made from a desk**

Supervisors spend hours reconciling paper instead of standing at the line where problems start.

4**Manual file hand-offs**

Raw-material lists, schedules, and reports pass hand to hand — breaking a little more each time.

5**No connection front-to-back**

The front office and the floor operate off different, disconnected pictures of the same day.

6**Delayed decisions**

By the time information physically reaches the person who can act on it, the moment to act has passed.

An information bridge, not a tracking tool.

This system began as a tool to get supervisors off the desk and onto the floor — to remove the guesswork and bias that creep in when decisions are made on incomplete or outdated information. It doesn't just record what happened. It connects every part of the operation — front end to back end — into one system, so decisions happen off the same real-time picture instead of waiting on a hand-off.

It keeps a full record as it goes and can push updates out automatically — so nothing depends on someone physically walking a form to the next department, or a supervisor being at a desk to notice something changed.

Floor-first, not desk-first — by design

- No install, no special hardware — works from any phone, tablet, or laptop.
- The same live numbers, visible to everyone, at the same time.
- Fewer decisions made on stale or secondhand information.
- Built to clear a real IT review — encrypted, role-based access, full audit trail.

The pattern is bigger than one industry

Real-time status, scheduling against real capacity, and manual hand-offs that break under pressure aren't unique to manufacturing. Food & beverage production, warehousing & distribution, field service, and healthcare/lab operations all run on the same shifts-and-fixed-capacity pattern — the results shown throughout this document are real, from a manufacturing floor personally run, and the same core system adapts to any of them.

Configure, don't code.

Every module is built around one rule: anything that changes from client to client — line count, shift pattern, product list — lives in a settings screen, never in code. If your team needs to call a developer to add a line or onboard a new product, the product has failed its own design goal.

1**Setup, not scripting**

A settings screen where you define line count, shift structure, and product list — no code touched.

2**Templated data in**

Upload into a locked template. The system tells you exactly what's wrong — no silent breakage.

3**Validation first**

Every upload is checked against expected structure before it touches any calculation.

4**Client-owned changes**

Your own supervisor or admin makes day-to-day changes. No developer required to keep it running.

The core batch workflow

One connected line, not eight disconnected hand-offs. Every module plugs into this sequence.

STEP 1**Material Gate****STEP 2****Prep / Staging****STEP 3****Batch Schedule****STEP 4****Quality Release****STEP 5****Line Ready****STEP 6****Production Execution****STEP 7****FG Recon.****STEP 8****Warehouse Movement**

Six modules, one shared data layer.

Batch Coordinator

Materials vs. demand — flags shortages before they cause a delay.

Material Prep Scheduler

Sequences prep and staging tasks by job priority.

Production Scheduler

Real capacity forecast from actual working days and available hours — not estimated.

Floor Coordinator

Live job status, crew assignments, and automatic shift hand-offs.

Plant Supervisor

Executive rollup — command center, capacity forecast, all jobs, sync status.

Sync & Export Hub

One source of truth across every device, with clean exports for leadership review.

◆ AI Insights — powered by Claude

A predictive layer, not a canned report: the system sends your current capacity, floor, and material data to Claude and gets back a specific, plain-language read on what's most likely to become a problem first — generated live from your actual numbers, not a script.

Numbers from floors personally run.

Not third-party case studies, not projections — results from operations personally led.

82% → 97%

Schedule attainment, driven by live scheduling and changeover visibility.

46% → 60%

Overall Equipment Effectiveness (OEE), from floor-execution and downtime tracking.

76

Person workforce moved off paper roll-call onto a digital daily tracking system.

75+

Continuous-improvement findings actioned in under a year through structured floor walks.

What made the difference

- Real-time visibility replaced end-of-shift discovery — problems got caught while they were still fixable.
- Capacity forecasting used actual working days, not assumed ones — schedules stopped breaking on holiday weeks.
- A digital daily record replaced paper roll-call for a 76-person, multi-department workforce.
- Structured floor walks turned informal observations into 75+ tracked, actioned findings in under a year.

Where this goes next.

Available now shown on the previous pages. Everything below is real roadmap — built as engagements grow into it.

IT & Security — built to clear a real review

● Browser-based

Any modern browser, any device — no install, no special hardware.

● Encrypted

HTTPS in transit, encrypted at rest — standard for cloud-hosted systems.

● Role-based access

Named logins, defined roles — no shared logins.

● Full audit trail

Every change is timestamped and attributable to a user.

Ways to work together.

Start small, prove it, then scale up.

MOST COMMON			
Day-Rate Consulting \$900 / day On-site or remote operations work, billed by the day — no long-term commitment. - Floor walks & assessment - Scheduling / capacity review - No commitment beyond the day	Operations Diagnostic \$2,500 flat A 1–2 week floor assessment quantifying what manual tracking is actually costing you. - On-site or remote review - Quantified cost of current process - Written findings report	Managed Retainer From \$1,800/mo Full build sized to your floor, hosted and maintained on an ongoing basis. - Full build across chosen modules - Ongoing hosting & support - No in-house IT hire needed	Standalone Build From \$18,000 One-time build and handoff. Configuration-driven, so your own team runs it. - Full build & handoff - Documentation for your team - You own and operate it

Diagnostic fee credits toward Standalone Build or first month of Retainer within 30 days. Standalone Build: 30% due at signing, remainder on delivery.

What moves the price above \$18,000

The base Standalone Build covers up to 5 lines, 1 site, and the 6 core modules. These factors add real scope — not arbitrary upcharges.

→ Line / site count

More lines means more config and validation work beyond the base 5.

→ Multiple facilities

Each site needs its own config layer and sync setup.

→ Roadmap modules

CI Tracker, Event/Alert Engine, and similar are separate build work.

→ ERP / system integration

Pulling live from an existing ERP, WMS, or BI tool is bespoke, priced per system.

→ Tuned AI Insights

A version trained on historical data, not just live snapshots.

→ Compliance / validation

Regulated environments (e.g. FDA, 21 CFR Part 11) need documented validation work.

Let's put this on your floor.

- 1 Book a walkthrough
- 2 Run the Operations Diagnostic
- 3 See your numbers move
